LOADSCOPE

Precision rifle load development for Mac & Windows

loadscope.app

App Overview

What it does

Loadscope reads the data you already collect at the range and tells you which load actually shot best — scoring every charge weight, seating depth or **barrel tuner setting** you tested. Your velocities import straight from the chronograph — a **Garmin Xero over its USB cable**, or an export from a LabRadar, MagnetoSpeed or Athlon. Your groups you measure right in the app from a photo of the target, or import from a target app or an electronic target — **BallisticX, OnTarget, ShotMarker or Silver Mountain Targets**. Once you have a winner, a built-in **ballistic solver** turns it into a **DOPE card**: drop and wind in MOA or mil, with spin drift and Coriolis when they matter — and it keeps whatever you **actually dialled**.

Beyond a single test

Every load you settle on stays in a searchable **Load Library**, so a whole season of workups lives in one place: reopen any of them, print a Recipe Card for the bench, or start a fresh ladder off an old load without retyping it. **Compare Loads** lines your saved loads up head to head — velocity SD, mean radius and vertical — and calls which one shot best. **Loadscope Ballistics** for iPhone and iPad, included with your license, adds recipe cards, synced barrel round counts, group measuring and live DOPE.

How it scores and picks your best load

Each charge you tested is scored on four measurements: **velocity flat-spot** (how little speed moves across neighboring charges), **velocity SD**, **mean radius** and **vertical SD**. Each is scaled across everything you shot and combined into one score. **The lowest wins**, and that load is named at the top of your results. The weights are **set from your test distance** — mean radius leads up close, velocity SD takes over at range — and you can set them yourself at any time. A seating-depth test is scored the same way, ranking jump instead of charge weight; a tuner test favors a run of good settings over a lone winner.

What it runs on

A native desktop app for **Mac and Windows** that works offline — no account, no subscription, no cell signal needed at the range. Loadscope does all of the math itself and writes the results into an Excel workbook you own and can keep forever; **Excel itself is optional** — you never need it to get an answer.
